HaptiMap

- “Haptic, Audio and Visual Interfaces for Maps and Location Based Services”
- HaptiMap aims at making mobile maps and location based services more accessible by using several senses like touch, hearing and vision
- Receives financial support from the EC in the 7th Framework Programme

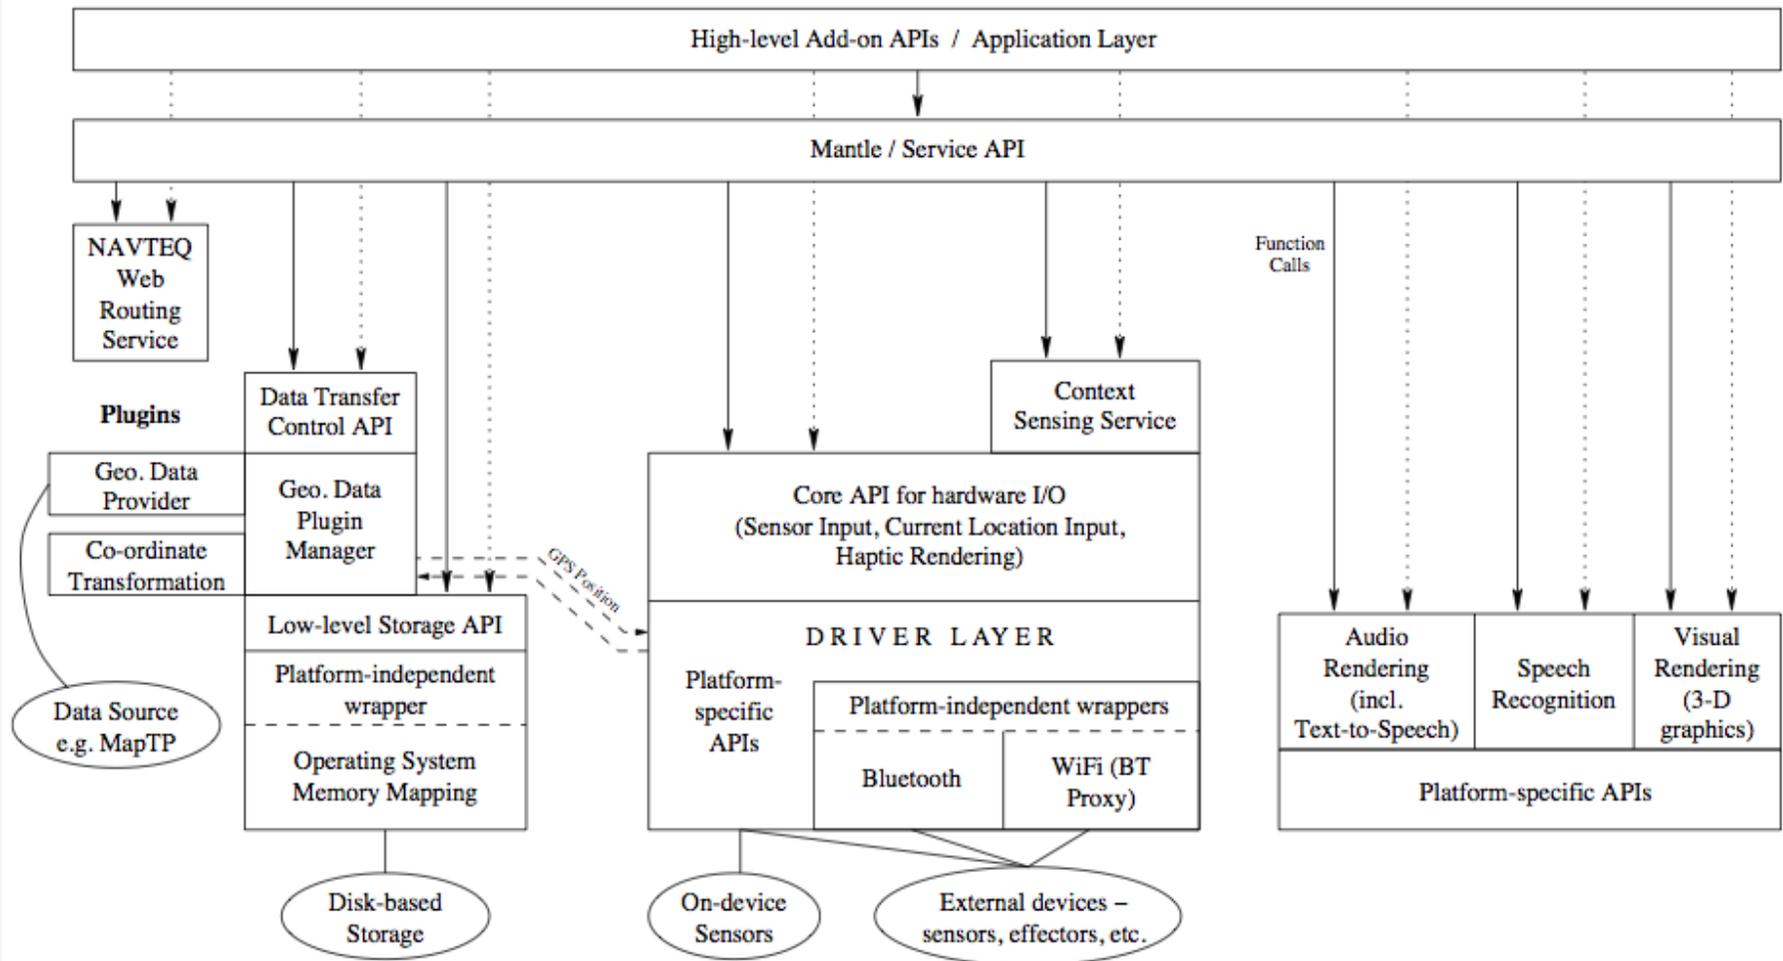

The HaptiMap toolkit

- The toolkit provides “tools” for mobile map application developers to enhance the accessibility of their applications
- Tools support several interaction modalities
- Open-source
 - Licensed under an umbrella of OS licenses
 - Subversioning, wiki, mailing list etc. are available
- Cross-platform
 - Android, iPhone (iPad), Windows Mobile, Meego, Symbian, ...

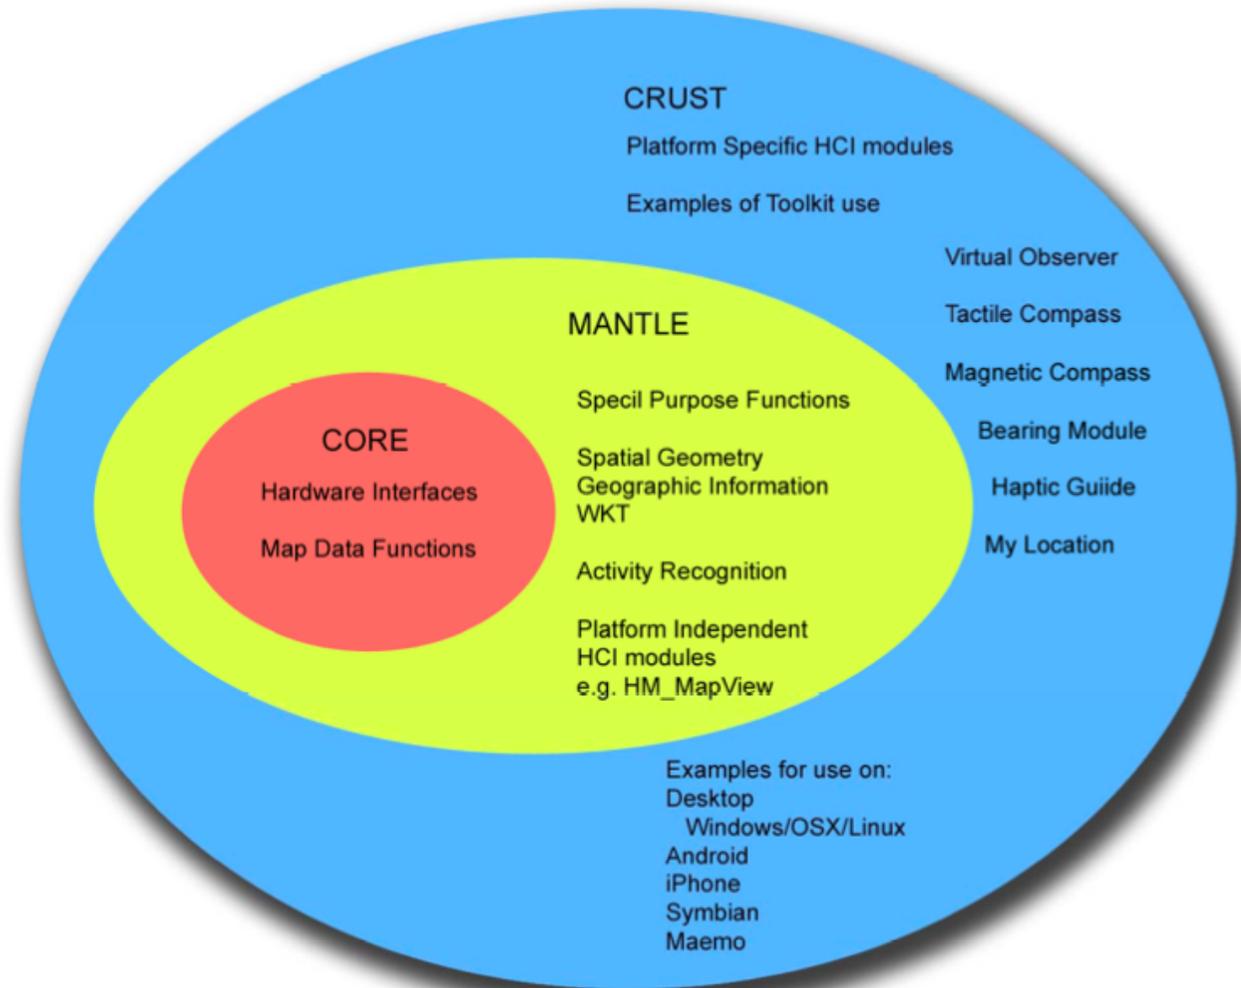

... The HaptiMap toolkit

- Made “simple” for the end users, such as
 - Human-Computer Interaction developers
 - Developers building on top of existing platforms and having a moderate knowledge of the spatial domain
- Simplicity is a compromise
- Is composed of three principal layers
 - Core, Mantle and Crust
- Plug-ins are a logically separate components
- Is a set of Application Programming Interfaces

The architecture

The architecture

The architecture – Core

- The core contains functions to access both in-built and external sensors
 - Accelerometers, tactile vibrators, speech engines, positioning, digital compass, ...
 - Parts of the core are platform-specific!
- The second task is handling and caching of geographic vector data
 - The data is stored in memory-mapped disk files
- Public interfaces for upper layers
- Currently licensed under LGPL

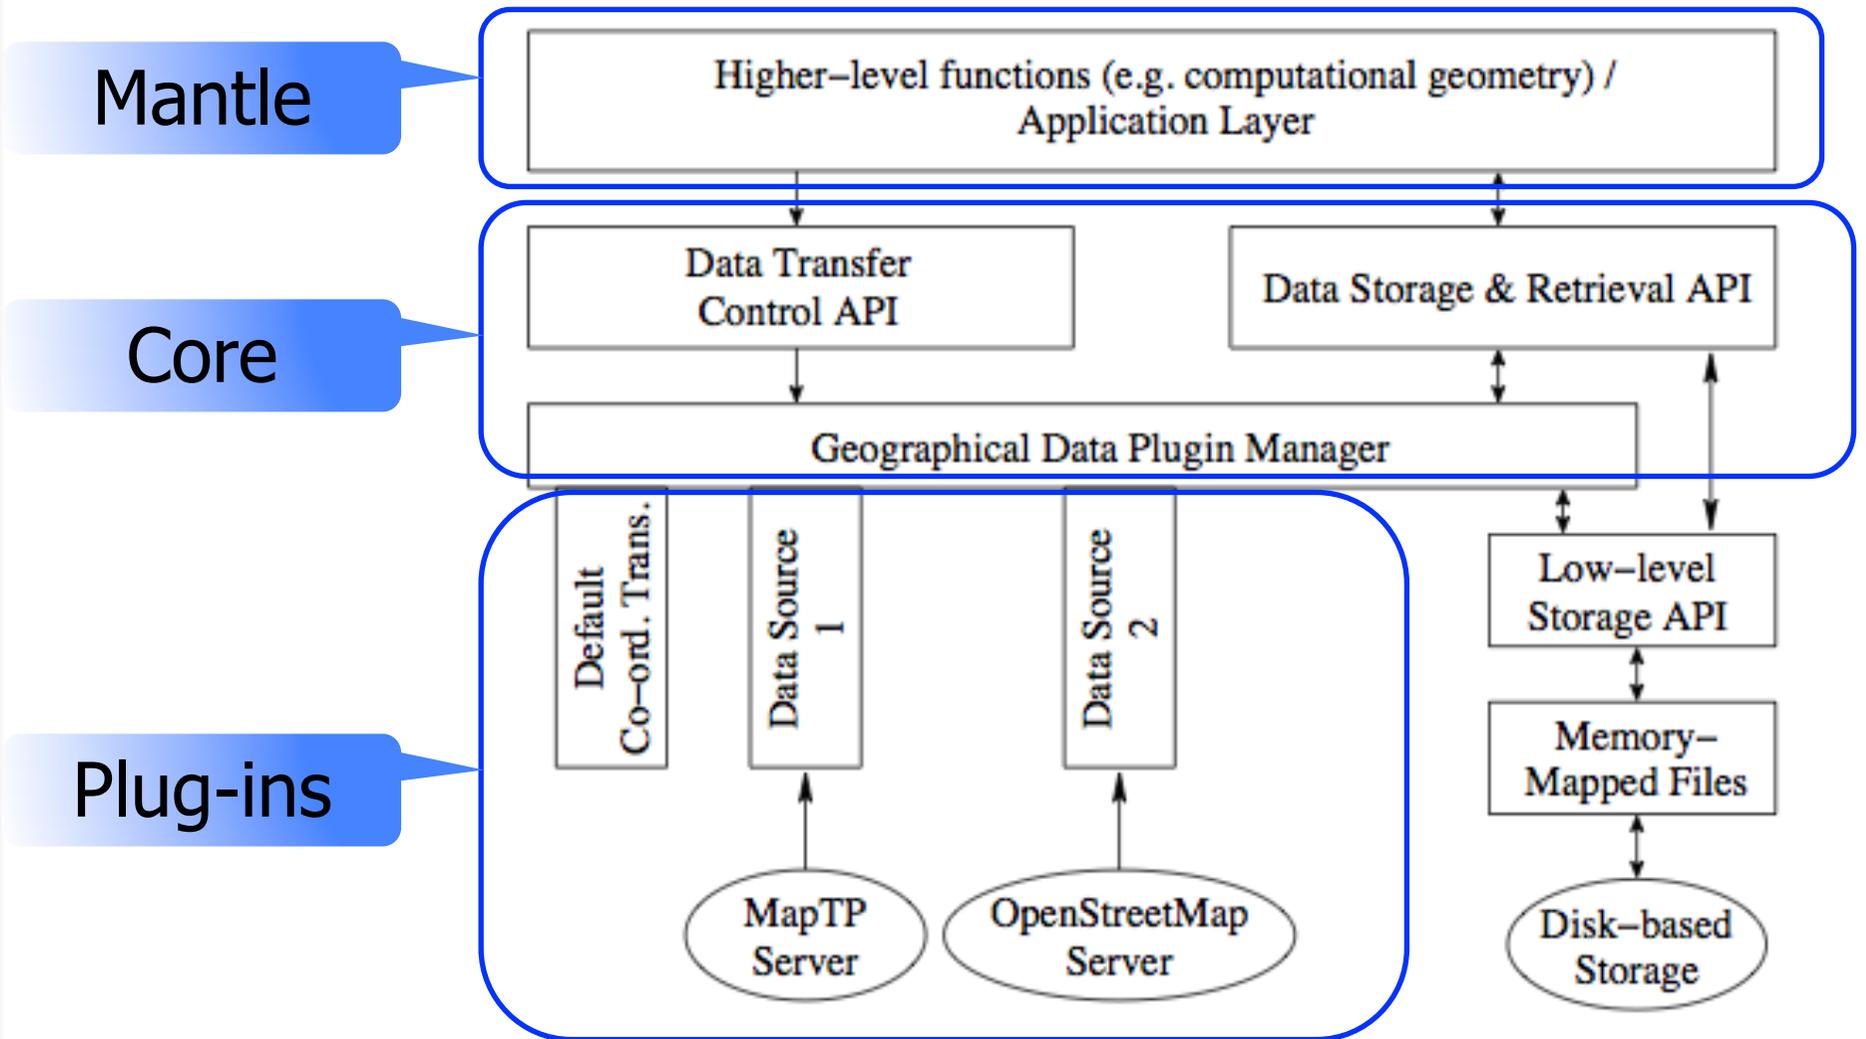

The architecture – Mantle

- Consists of platform-independent human-computer interaction modules
 - Act as building blocks
 - Contain analysis and processing support
- Includes computational geometry functions
 - Supports the HCI modules
 - Data is always read from the internal data storage
- Written in ANSI-C
- Currently licensed under LGPL

The architecture – Crust & Plug-ins

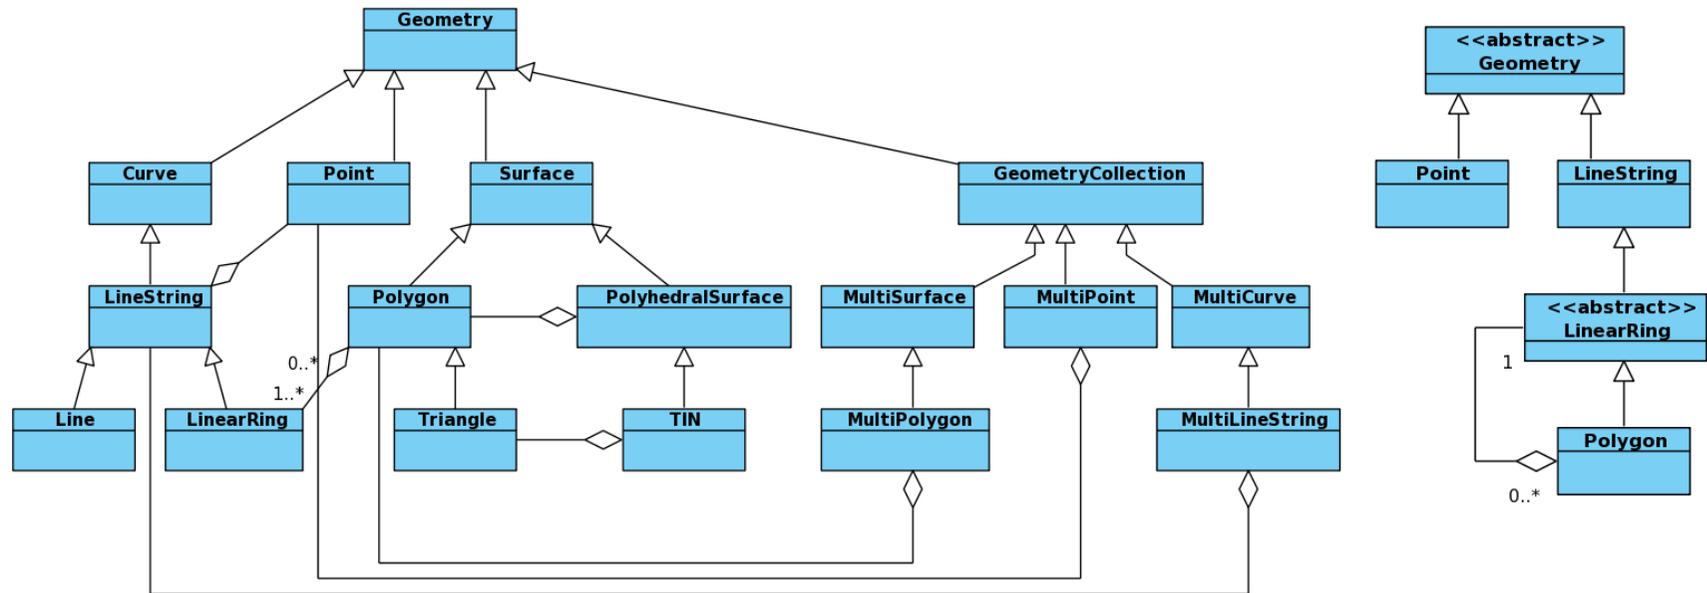

- Crust contains platform-specific components
 - Human-Computer Interaction modules
 - Views, view controllers, view activities, fragments, ...
 - Examples
- Plug-ins are used for
 - Reading data from external data sources
 - Perform model transformation to the internal model
 - Co-ordinate reference system support
 - The leading plug-in defines the reference system
- Any suitable license may be used

Geographical data loading

The geometry model & data types

- Geometries are 2D (+1D) points and linestrings
- Polygons are defined by the internal data storage
- Co-ordinates are stored as 32-bit integers
- The internal Unit of Measure is centimeters

Computational geometry functions

```
/* Metric methods */
HM_RESULT hm_geom_area(hm_t *hm, int lid, double *area);
HM_RESULT hm_geom_bearing(hm_t *hm, int pid1, int pid2, double *angle);
HM_RESULT hm_geom_distance(hm_t *hm, enum HM_GEOMETRY_TYPE gtype1, int fid1,
    enum HM_GEOMETRY_TYPE gtype2, int fid2, double *dist);
HM_RESULT hm_geom_distance_hausdorff(hm_t *hm, enum HM_GEOMETRY_TYPE gtype1,
    int fid1, enum HM_GEOMETRY_TYPE gtype2, int fid2, double *dist);
HM_RESULT hm_geom_length(hm_t *hm, int lid, double *length);
/* Spatial predicates */
HM_RESULT hm_geom_contains(hm_t *hm, int polyfid,
    enum HM_GEOMETRY_TYPE gtype, int fid, int *r);
HM_RESULT hm_geom_within(hm_t *hm, int fid, int polyfid,
    enum HM_GEOMETRY_TYPE gtype, int *r);
HM_RESULT hm_geom_intersects(hm_t *hm, enum HM_GEOMETRY_TYPE gtype1,
    int fid1, enum HM_GEOMETRY_TYPE gtype2, int fid2, int *r);
/* Overlay methods */
HM_RESULT hm_geom_intersection(hm_t *hm,
    enum HM_GEOMETRY_TYPE gtype1, int fid1,
    enum HM_GEOMETRY_TYPE gtype2, int fid2,
    enum HM_GEOMETRY_TYPE *r_type, int *r);
/* Buffering */
HM_RESULT hm_geom_buffer(hm_t *hm, int fid, enum HM_GEOMETRY_TYPE gtype,
    double buffer_width, int *r);
/* Generalisation etc */
HM_RESULT hm_geom_simplify(hm_t *hm, int lid, double tolerance, int *r);
HM_RESULT hm_geom_centroid(hm_t *hm, int lid, int *r);
HM_RESULT hm_geom_interior_point(hm_t *hm, int lid, int *r);
HM_RESULT hm_geom_convex_hull(hm_t *hm, int lid, int *r);
HM_RESULT hm_geom_mbr(hm_t *hm, int lid, int *mbr_id);
HM_RESULT hm_geom_ray_intersection(hm_t *hm, int lid, int pid,
    double angle, double *distance);
```

Performance comparison

- To validate our approach we performed a performance comparison between solutions
- We applied both unit testing and benchmarks
- The benchmarks were run on the iPhone & iPad
- Three different cases were benchmarked
 - Toolkit – Data already stored in the internal storage
 - GEOS geometry engine (v. 3.2.2) – Data conversion was performed before running the benchmarking
 - Wrapping GEOS – Data in the internal storage was converted during benchmarking from the internal data model to data model of GEOS

Performance comparison results

... Performance comparison results

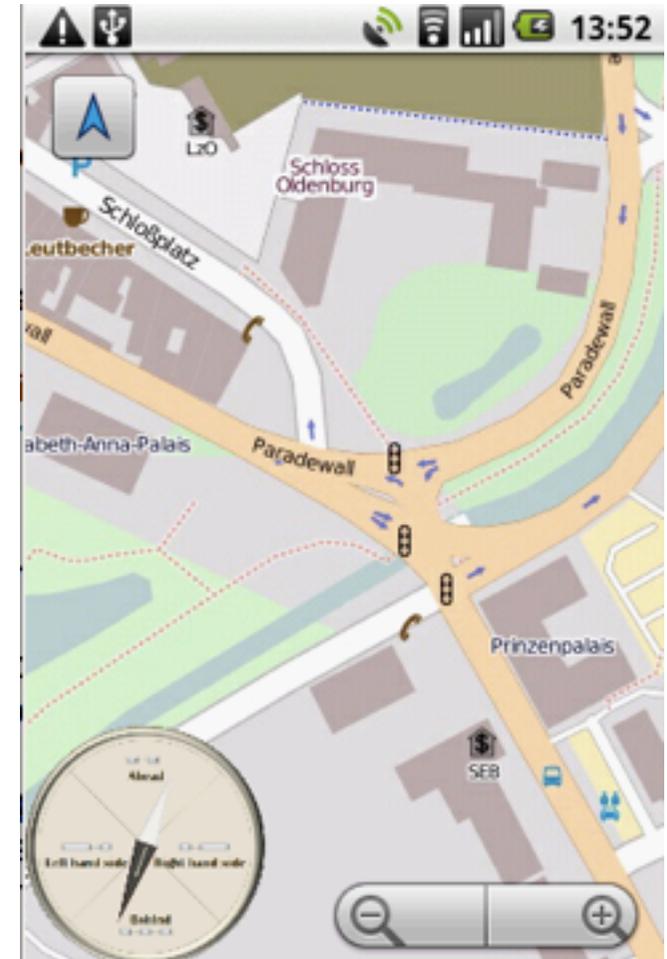

- The internal data storage size increment should be modifiable
- The benchmarking proved the module to be in general faster compared to GEOS
- The solution was tested to be 2-20 times faster than wrapping GEOS functions!

Figure: Results on the iPad 2

Conclusions

- The HaptiMap toolkit may be used to advance accessibility
- Our approach of implementing own optimized computational geometry handling is
 - Significantly faster in comparison to alternative solutions
 - Allows taking into account specific HCI needs/requirements
 - May be extended by wrapping complex functions

Thank you!
